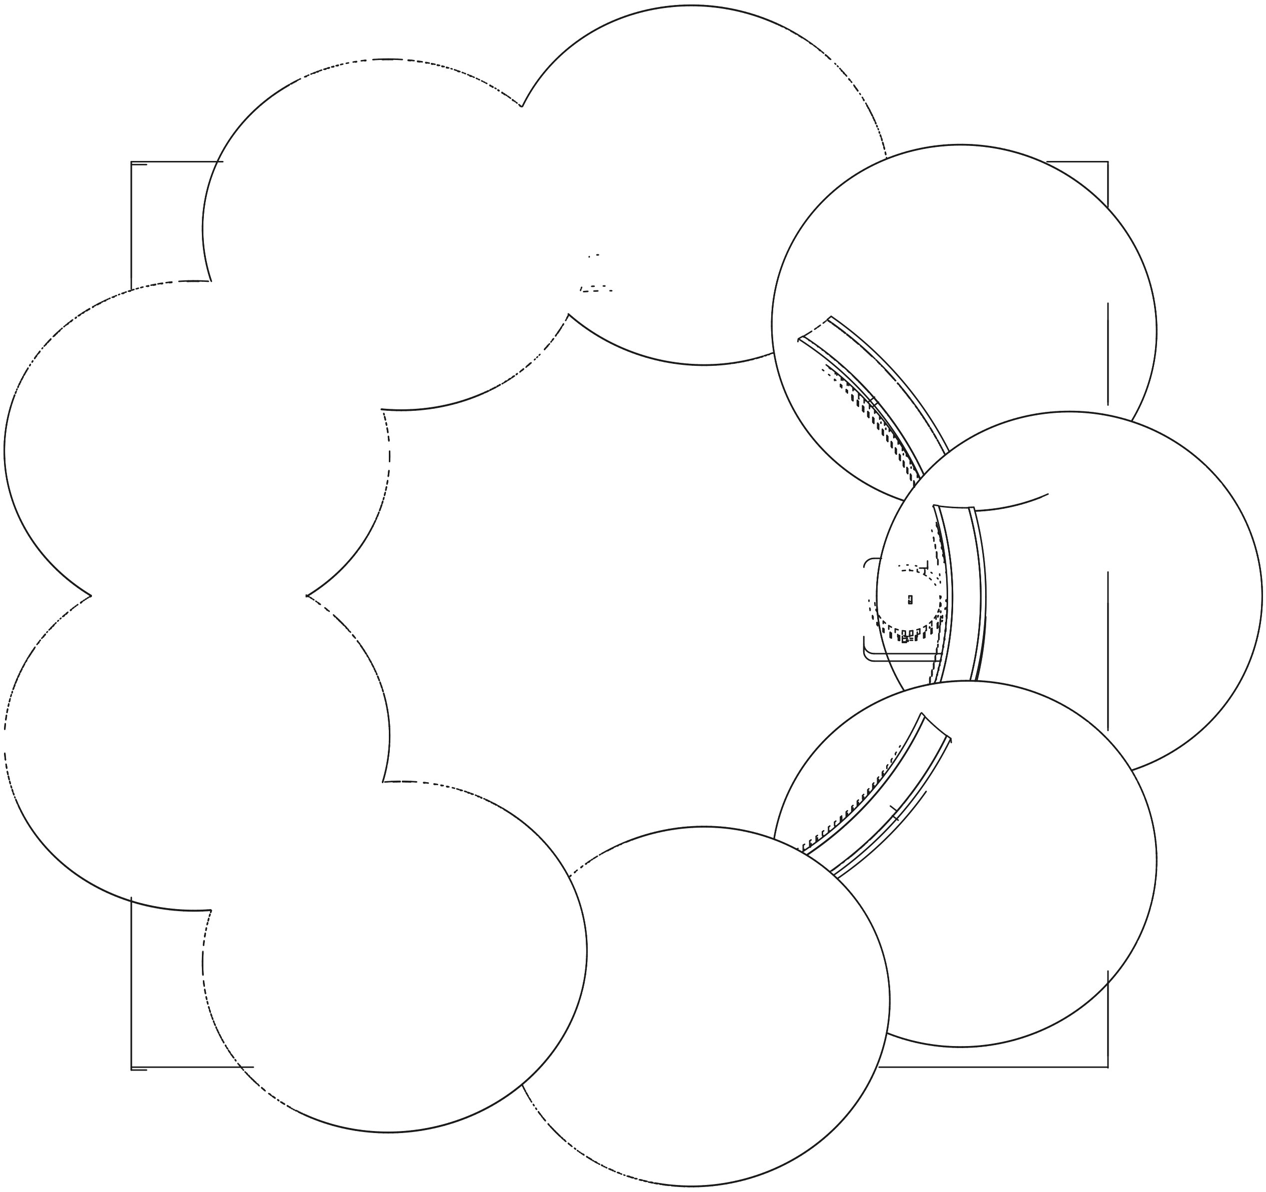
KISELRING

rotating silicon-wafer halo · Ø1.0 m · 1.8 kg

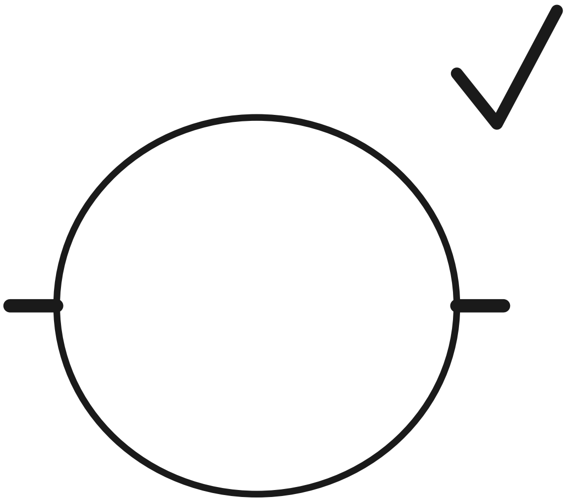
kisel (Swedish): silicon

×1

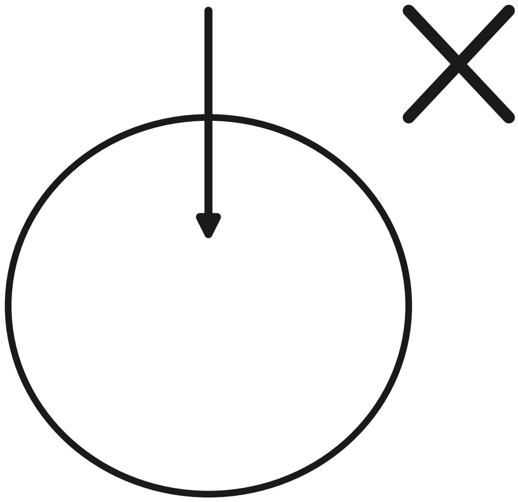
9 × Ø300 mm wafers · 252:28 = 9:1 internal drive · no tools on the frame



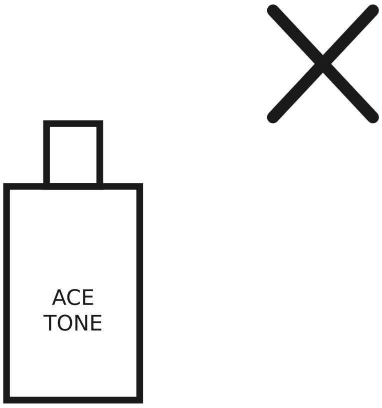
!



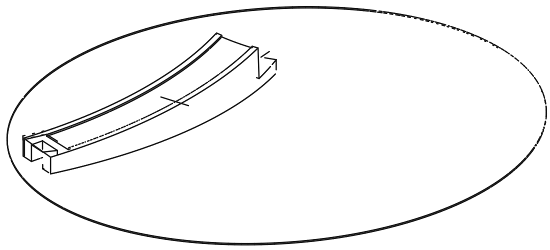
edges only



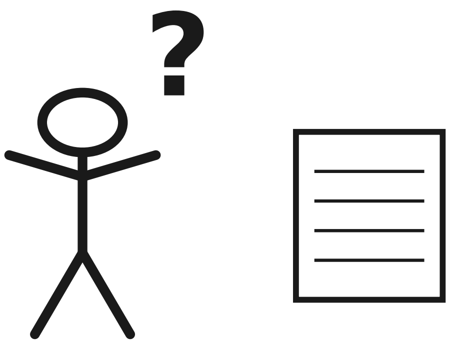
never press the middle



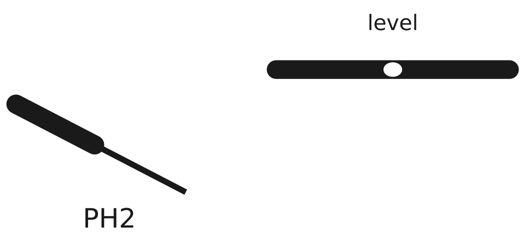
IPA on glass only — never on the frame



wafers already bonded? see cure-jig manual (OP 012)



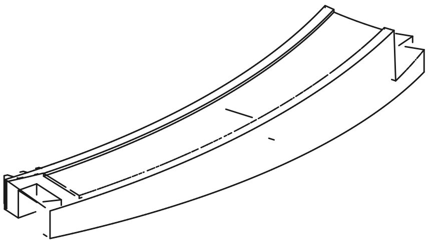
docs/index.html



no hammer. ever.

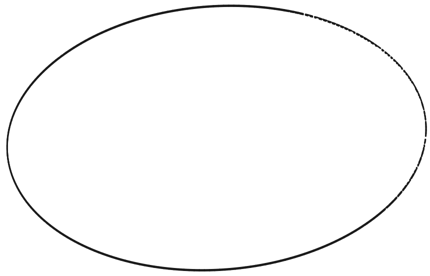
in the box

×9



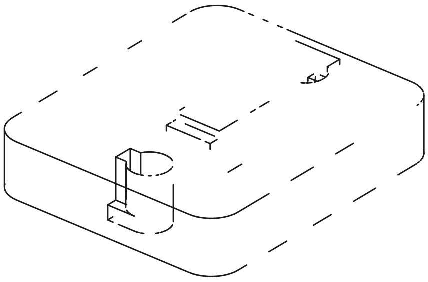
frame segment

×9



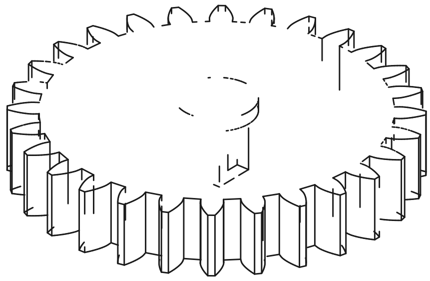
Ø300 wafer (bonded)

×1



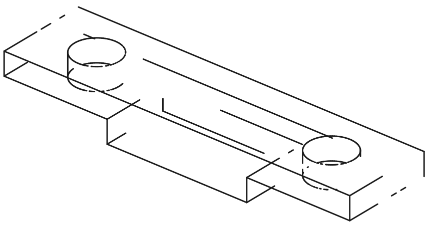
drive plate

×1



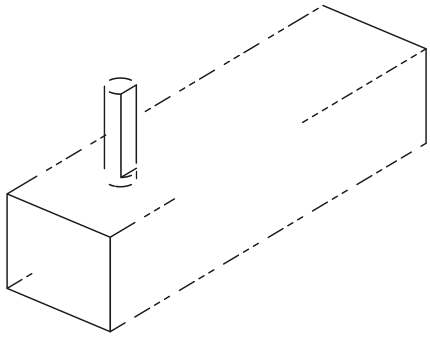
28T pinion

×1



motor clamp

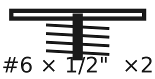
×1



N20 worm gearmotor

hardware

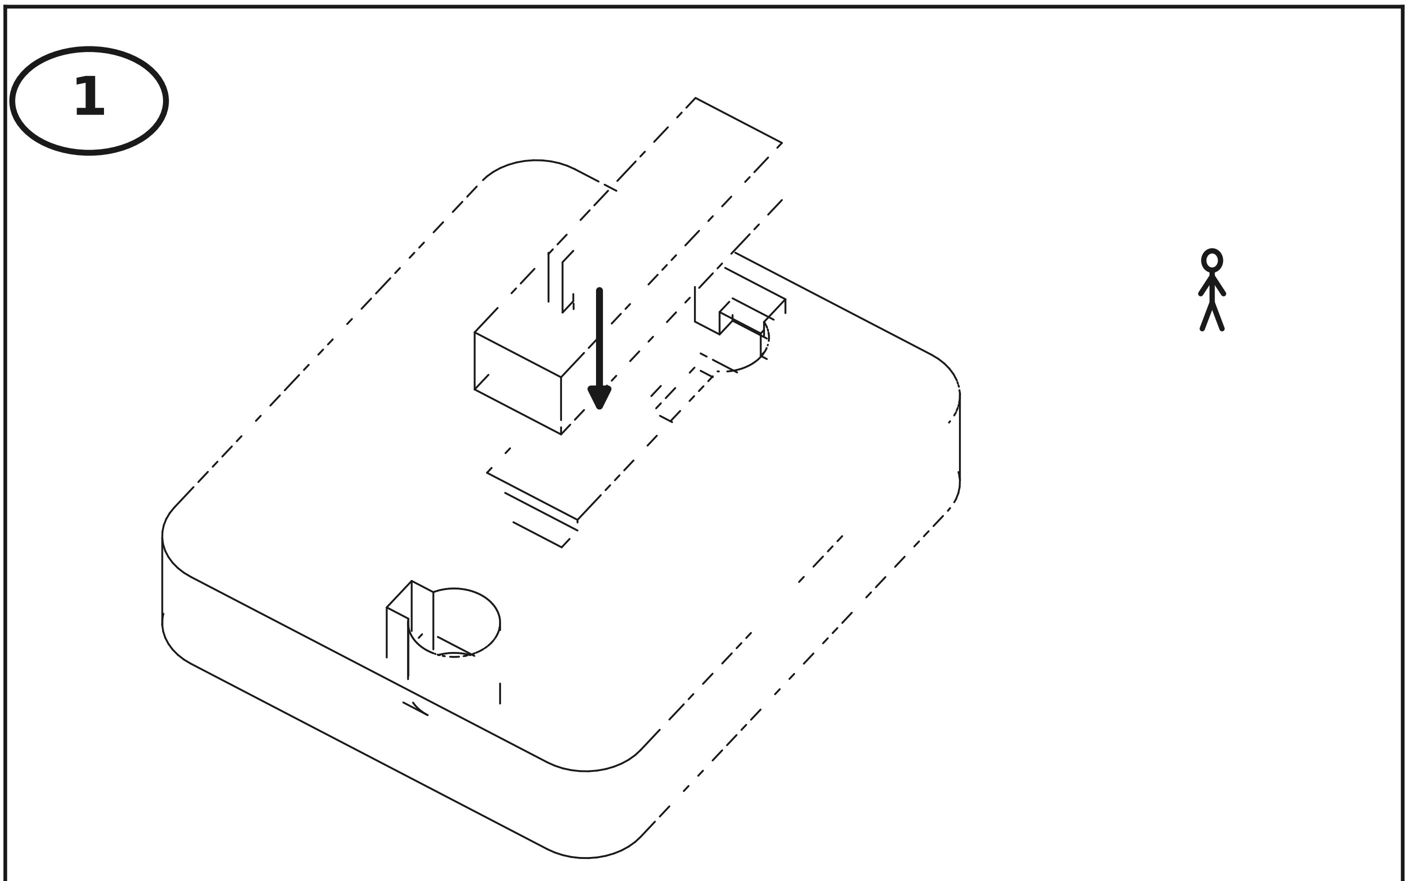
#10-24 pan ×2
(in your bracket)



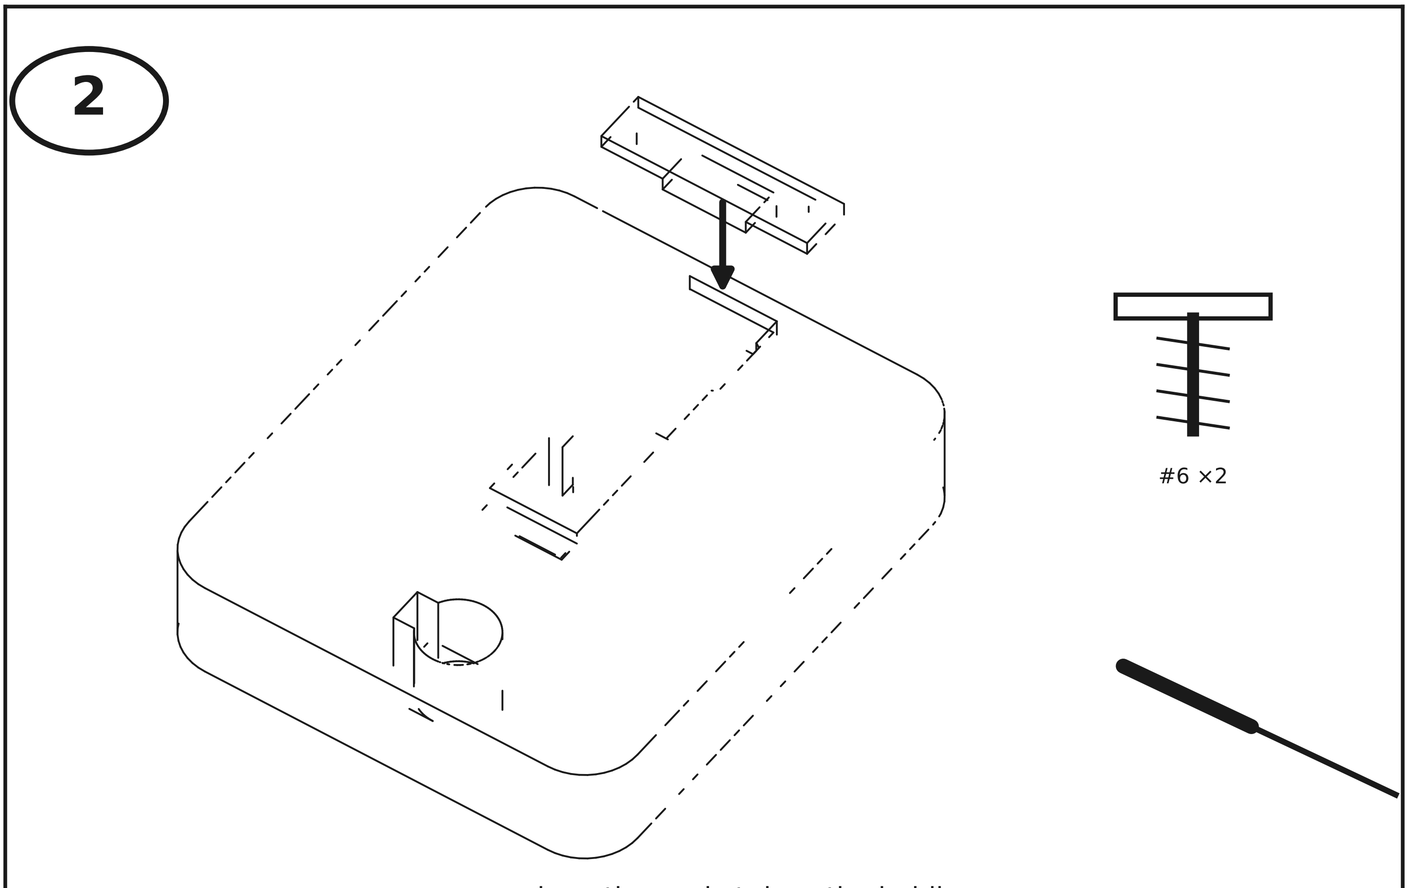
#6 × 1/2" ×2

USB / 5 V DC ×1

not included: wall bracket with two #10-24 pan heads, 56 mm apart (see step 4)

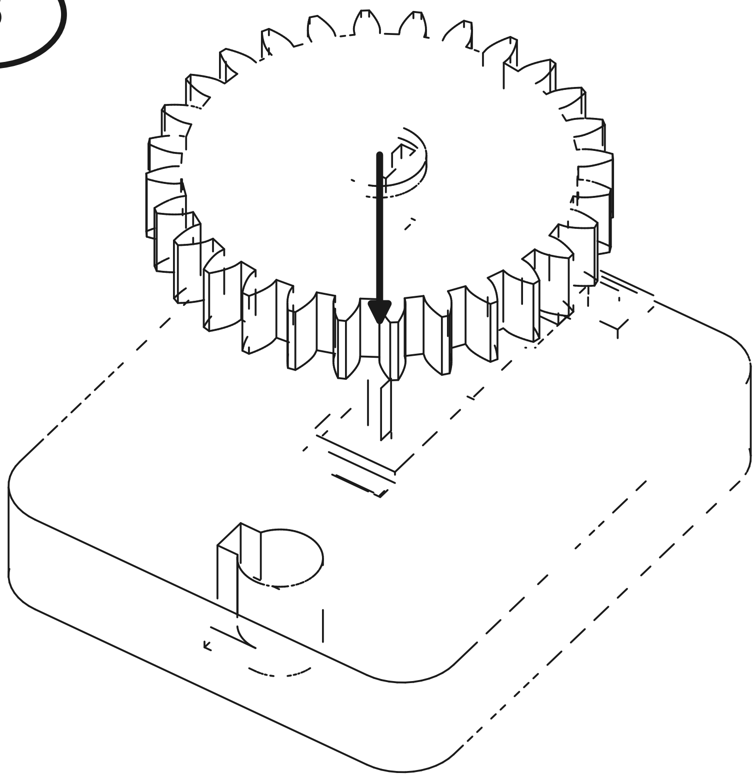


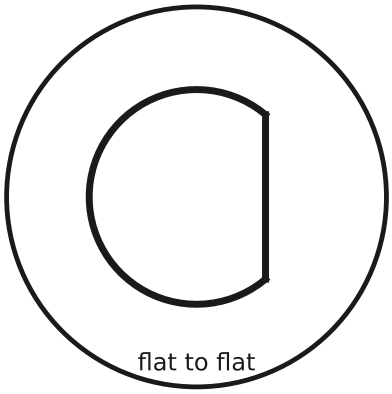
nose first, under the lip — then drop the tail



snug only — the pocket does the holding

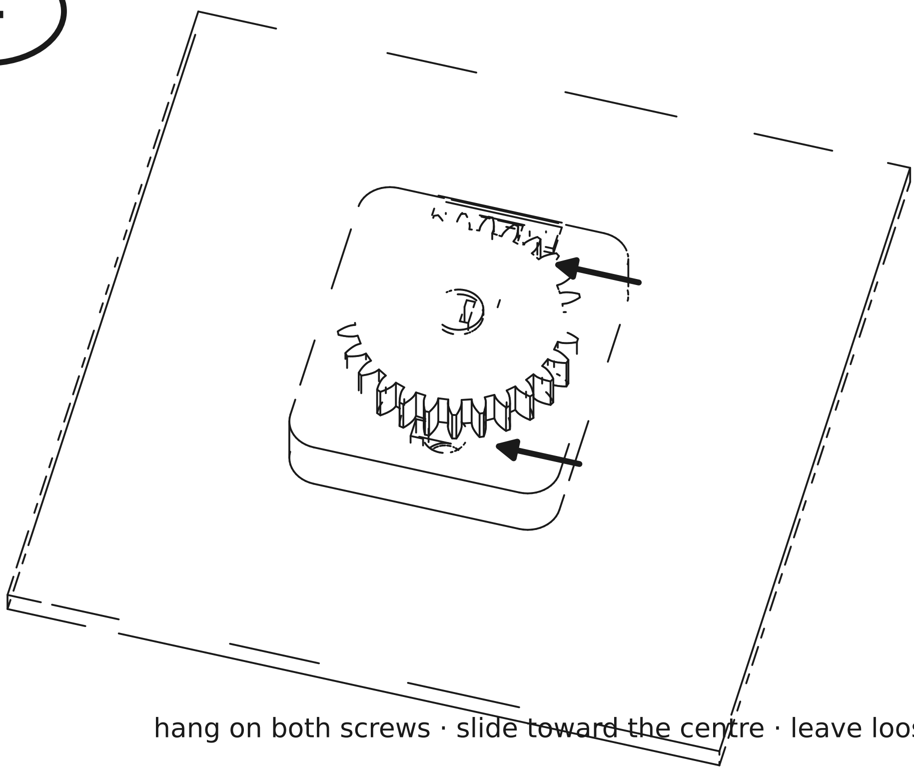
3





push on until the collar seats — no glue needed

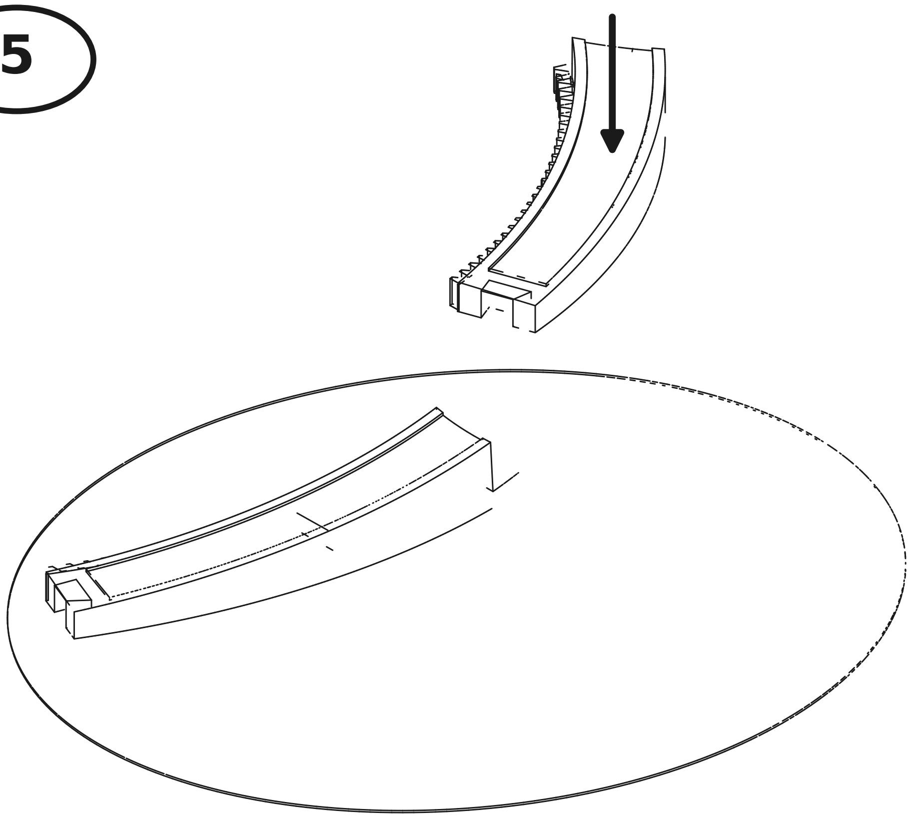
4



hang on both screws · slide toward the centre · leave loose for now

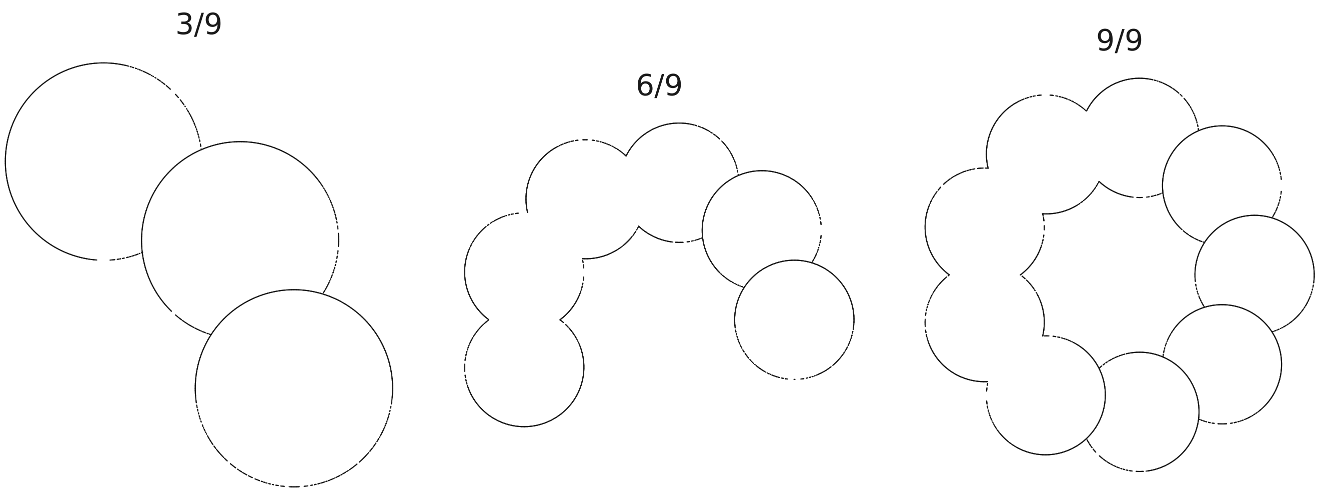
bracket screws: #10-24 pan heads, 56 mm apart, heads 4 mm proud

5



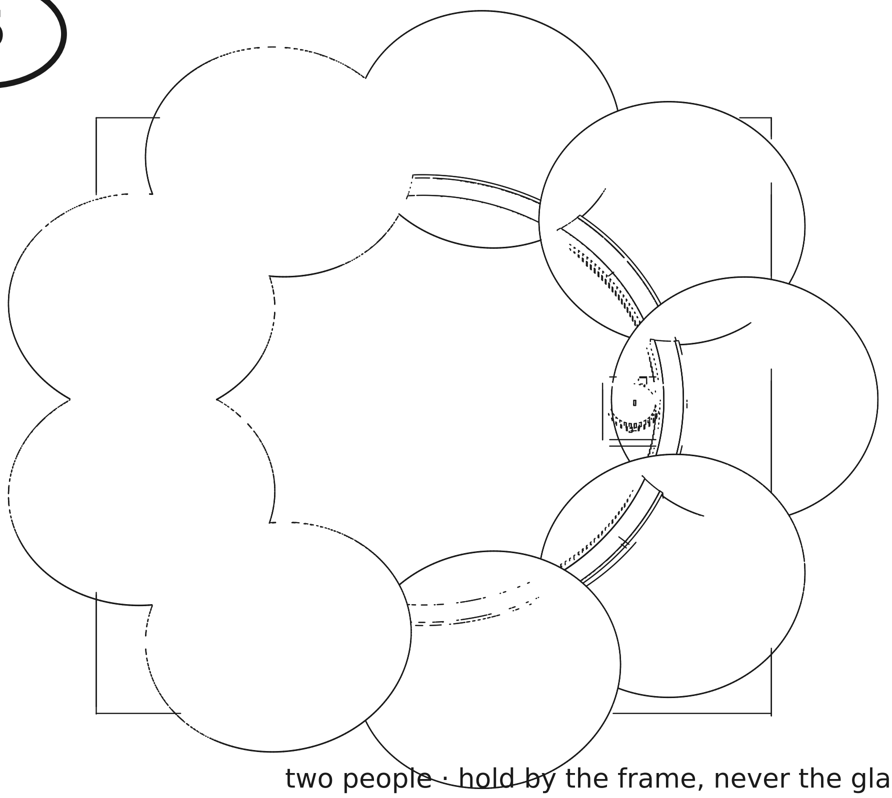
×9

flat on the bench · slide straight down · edges only on the glass



the last dovetail closes the circle — do not force; if it fights, a joint is not seated

6

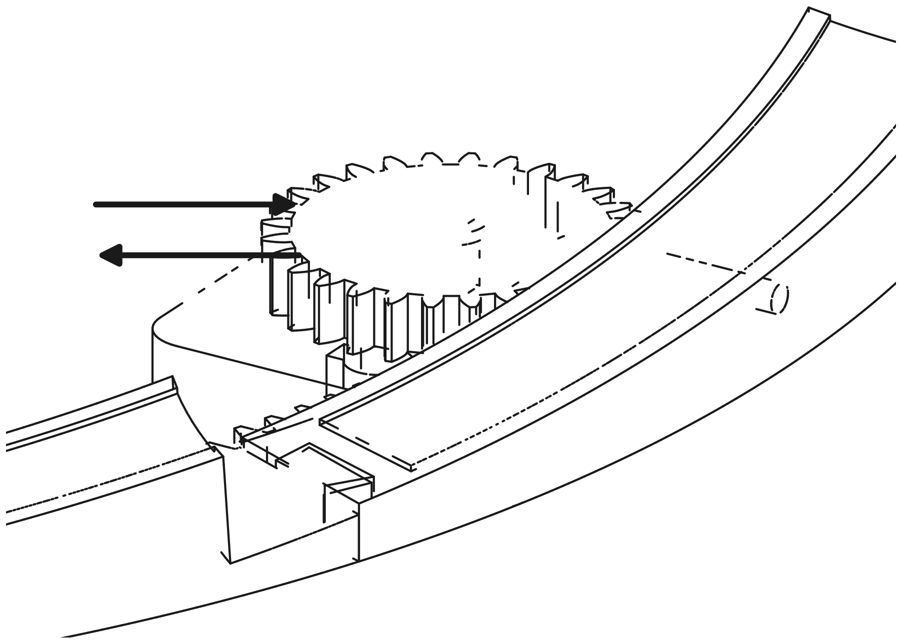


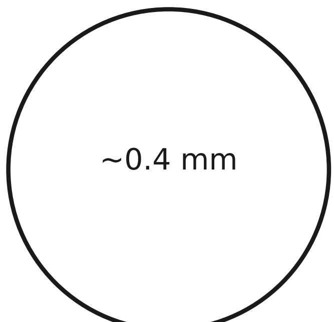
×2

two people · hold by the frame, never the glass

ring support (rollers) per the traveler — this manual covers the drive

7

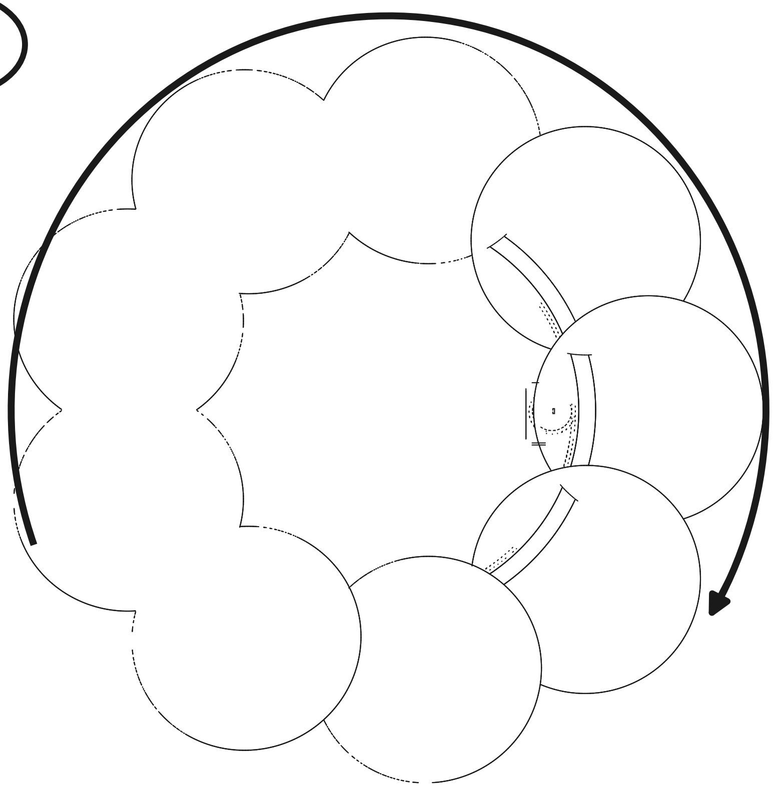




a hair of backlash,
not a bite

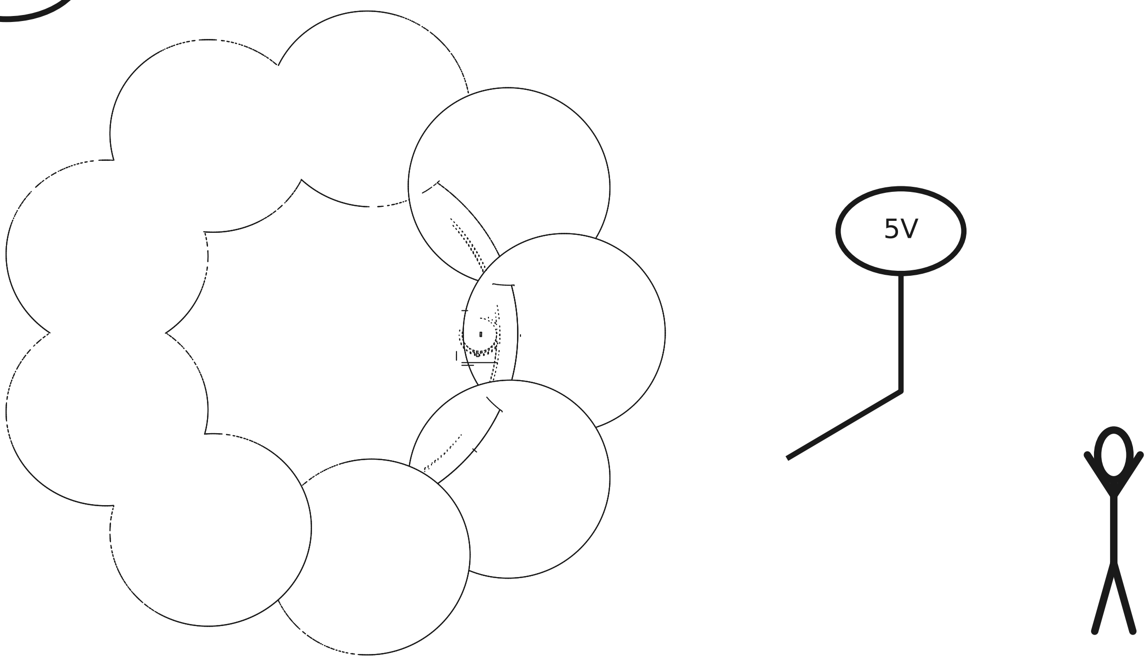
slide the plate until the teeth just kiss, back off a hair, tighten both bracket screws

8



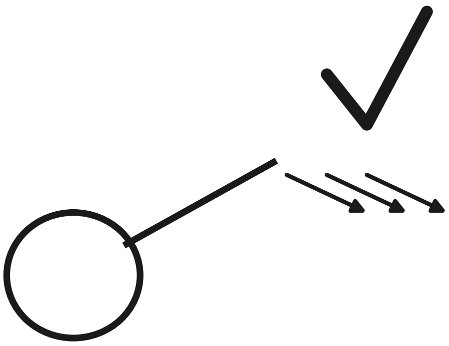
one slow lap by hand — smooth everywhere, no clicks, no rubs

9

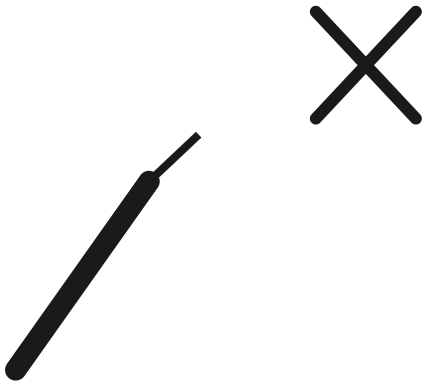


~1 rpm of quiet, self-holding rotation · done

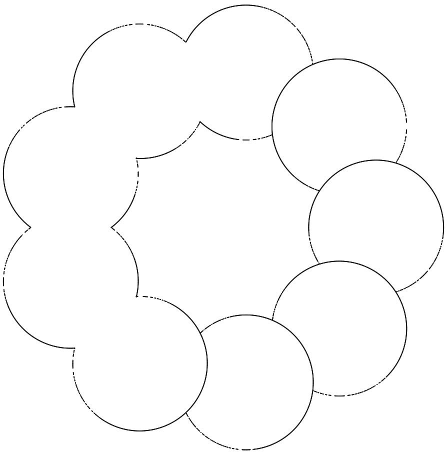
care



dust: blower only



no cloths, no sprays on the glass



it is a mirror, a clock with no hands, and 4.5 kg of sand that went to college
